

Query	Response
Can you repeat what's consission ? In the context ?	Yes, so Concision should evaluate how succinct the response is, if it's clear and to the point. So issues related to Concision are: repetitiveness, including irrelevant/redundant information, etc. Concision also includes any kind of wordcount requested by the user (or information such as the user asking for a detailed, or short response). <u>So this dimension evaluates how well the response is written, in accordance with the user's request (no distractors, easy to find the requested information, follows any length restrictions)</u>
If the user request is harmful, and the model refuses to answer, do we consider the conciseness if it only refuses or argues about the reasons why it refuses and provides guidelines	Please remember to individually grade each response, not to compare each dimension between the responses. Even though one is longer than the other, as long as they individually fulfil the criteria, so if they are to the point, not repetitive, and don't contain distractors, they can both be considered Concise.
Estimated time for this task?	Around 15 minutes
I still have doubts about this concept: if a response provide a wrong statement it must be downgraded in truthfulness or also on instruction following.	If there is a wrong/incorrect statement in a response, then you should downgrade the Truthfulness dimension (so mark a Major/Minor issue for this dimension). Since each dimension should be considered individually, Truthfulness is unrelated to Instruction Following, i.e. just because a response is incorrect, it doesn't mean that the instructions weren't followed. Please check the example from the ppt below: <u>User Request: What is the capital of France</u> <u>Response: Marseille</u> So in the above example, the only (implicit) instruction is to provide an answer to the user's question, which is what this response does, i.e. it attempts to answer the question. So this instruction is

	followed. Since the response is incorrect however (because the capital of France is Paris, not Marseille), then we should downgrade this in the Truthfulness dimension only.
Is it possible to have the percentage results of the three certification s?	Unfortunately, no
I received an invitation to take 3 certification (AFM, PR and GM safety). I want to know please which one is urgent and has currently production data in FR market ? Thanks	For now, PR is the priority workflow for all locales
Is it possible to receive the percentage of passed or not passe the certification? Example 60/70% or something like that	Unfortunately, no
Which dimension is considered as the most important when rating the overall satisfaction?	When it comes to the Overall Satisfaction, the most important thing is the cumulative effect, so number of Major/Minor errors, by following the Guidelines on page 4. Of course an 'additionally' important dimension would be the Harmlessness/Safety one, because a Major issue logged for this dimension immediately warrants a Highly Unsatisfying Satisfaction rating (as opposed to having at least 2 Major issues in any of the other dimensions) Image Understanding and Truthfulness are also important, since they are related, i.e. if you find a Major/Minor issue in Image Understanding, this has to be reflected as a Major/Minor issue in Truthfulness as well, as discussed in the ppt (since Image Understanding is part of Contextual Correctness, which is part of Truthfulness)
I was just wondering where I can find the project details, such as the hourly pay rate, the project duration, and when the production tasks will begin? Thanks	This sort of information can be found in the SOW shared with you. If there are any questions though, please get back to us at: Isaac_cherryopal OPS@centific.com
Isn't harmfulness the most important dimension? I mean, if the response is harmful, it's automatically highly unsatisfying	In a way, yes :) If a Major issue is found in the Harmlessness/Safety dimension, this automatically makes the response Highly Unsatisfying. But if the Safety issue(s) found are Minor, then this dimension has

	the same impact as any other dimension, according to the Guidelines
If the user request is considered harmful, and the models refuse to response, but one response is only the refusal, and the other explained the reasons why, and include additional resources about the issue, should we consider one response more concise than the other, or better because it provides additional information	Please remember to individually grade each response, not to compare each dimension between the responses. Do not penalize the response based on the length of another response. So even though one is longer than the other, as long as they individually fulfil the criteria, are to the point, not repetitive, and don't contain distractors, they can both be considered Concise.
Will we have to do a new certification for this type of tasks?	For now, there is no certification on the client's side for this Multi-Modal workflow :)

Notes:

- Whenever you have any questions about the project, certifications, etc. please log a query in [Global Query](#) 😊
- And here are the Multi-Modal Grading Guidelines for this workflow: [AFM Multi-Modal Grading \(Vendor\).pdf](#)
