

How would this scenario be evaluated? Let's say Pizza and Burgers are two options from the actual input text.

Title: Food Options

Options:

- Pizza and Burgers
- [empty]

Two options are provided in one line, rather than separately. We assume this would affect Composition, but what about Instruction Following, would it be failed?

Can we assume groundedness and comprehensiveness are not affected by the fact these two are presented as ONE option?

This example does well on Instruction Following, as how we define "Following" in the GL. No issues there. I believe it should also score well on Groundedness.

However, it performs poorly on Composition, as per the GL. It is debatable as to whether this is Comprehensive or not, since the GL states "The poll options appear in the same order as which they were first mentioned in the preceding conversation" in order to be Comprehensive. One can argue that these options are not presented in the same order as the conversation, since they are presented at once.
