

Project	Question	Screenshot	Certific's take	Resolution	Status												
Intelligent Polls	If "No poll is appropriate" is selected and the response is empty, do we need to penalize any dimension? Should the rating be "Following", "Good", "Comprehensive", and "Grounded"?	<table><tr><td>PersonB: Any good and not so expensive restaurant in the downtown area?</td><td>None</td><td>Following</td><td>Participant is seeking advice and not trying to reach a consensus, so no poll is required</td></tr><tr><td>PersonA: Depends on what you are in the mood for. Salermas is good for Mexican or dogtown for a good hellog. There's a lot.</td><td></td><td></td><td></td></tr></table>	PersonB: Any good and not so expensive restaurant in the downtown area?	None	Following	Participant is seeking advice and not trying to reach a consensus, so no poll is required	PersonA: Depends on what you are in the mood for. Salermas is good for Mexican or dogtown for a good hellog. There's a lot.					If no poll is appropriate and the response is empty, this means the model behaves correctly. So please do not penalize any dimension as this will indicate the reponse as a poor result in the backend.	Close				
	PersonB: Any good and not so expensive restaurant in the downtown area?	None	Following	Participant is seeking advice and not trying to reach a consensus, so no poll is required													
PersonA: Depends on what you are in the mood for. Salermas is good for Mexican or dogtown for a good hellog. There's a lot.																	
Intelligent Polls	If "No poll is appropriate" is selected and the response is not empty, we know how to rate "Following Instructions", "Composition" and "Groundedness" ("Not Following", "Good", "Grounded" for Screenshot), but we are not sure how to rate the comprehensiveness?	<table><tr><td>PersonB: Any good and not so expensive restaurant in the downtown area?</td><td>Title: Best Downtown Restaurant</td><td>Good</td><td>The poll title and options are well-composed, despite this being an inappropriate scenario for a poll.</td></tr><tr><td>PersonA: Depends on what you are in the mood for. Salermas is good for Mexican or dogtown for a good hellog. There's a lot.</td><td>Options: - Salermas - dogtown</td><td></td><td></td></tr></table>	PersonB: Any good and not so expensive restaurant in the downtown area?	Title: Best Downtown Restaurant	Good	The poll title and options are well-composed, despite this being an inappropriate scenario for a poll.	PersonA: Depends on what you are in the mood for. Salermas is good for Mexican or dogtown for a good hellog. There's a lot.	Options: - Salermas - dogtown				From engineering DRI: The graders should follow the guidelines for comprehensiveness. They should do their best to determine if the poll meets the requirements for being comprehensive, even though they have decided that no poll is appropriate. I know this may be an odd task for examples where a poll seems like the last thing to suggest.	Close				
	PersonB: Any good and not so expensive restaurant in the downtown area?	Title: Best Downtown Restaurant	Good	The poll title and options are well-composed, despite this being an inappropriate scenario for a poll.													
PersonA: Depends on what you are in the mood for. Salermas is good for Mexican or dogtown for a good hellog. There's a lot.	Options: - Salermas - dogtown																
Intelligent Polls	As per the guideline, if a poll is generated, but it omits one or more options, or contains repeating options, it should be rated "Not Following". This last point essentially means that comprehensiveness and perhaps groundedness affect the rating of IF as well. Meaning, if options are omitted (not comprehensive), the response is rated as "Not following". Is that the correct understandnig? Would that mean that if the option is also not grounded, it would be not following?	▪ Not Following: the response doesn't meet the requirements for Following. For example: ○ A poll is generated when it should not be. ○ No poll is generated when there should be one. ○ A poll is generated, but it misses a title, or omits one or more options, or contains repeating options. <table><tr><td>PersonA: Should we order some food?</td><td>Title: Food Choice</td><td>Comprehensive</td><td>The poll includes all options mentioned by the participants, despite the fact that it adds another option to the poll.</td></tr><tr><td>PersonB: pizza!</td><td>Options: - pizza - burgers - perogies</td><td></td><td></td></tr><tr><td>PersonC: I'd prefer some burgers</td><td></td><td></td><td></td></tr></table>	PersonA: Should we order some food?	Title: Food Choice	Comprehensive	The poll includes all options mentioned by the participants, despite the fact that it adds another option to the poll.	PersonB: pizza!	Options: - pizza - burgers - perogies			PersonC: I'd prefer some burgers				Addendum: If the options are not grounded (hallucinations, contradictory) it means the model is omitting the options explicitly mentioned in the input as per the GLs. So the response would be both not grounded and not comprehensive, which means groundedness can affect IF. Can you confirm this is correct? If not, the wording in the GL is misleading. Yi-Ting Chang	Your reasoning for Comprehensiveness is correct and aligned with the guidelines.	Close
	PersonA: Should we order some food?	Title: Food Choice	Comprehensive	The poll includes all options mentioned by the participants, despite the fact that it adds another option to the poll.													
PersonB: pizza!	Options: - pizza - burgers - perogies																
PersonC: I'd prefer some burgers																	
	<table><tr><th>Input Text</th><th>Response</th><th>Rating</th><th>Explanation</th></tr><tr><td>PersonB: This week is endorsement week isn't it? Does anyone think we get a VP pick later this week? PersonA: I don't know, we're hitting the peak of deaths right around now. Maybe next week or this week after at the earliest. PersonC: It's usually not until very close to the convention. Maybe June this time though since everything has been wrapped up sooner? PersonA: Maybe, though a May announcement wouldn't surprise me. PersonB: Since you're an Amy supporter, are you thinking she'll be VP? I still think it'll be Kamela, but the Amy rumors are swirling as well.</td><td>Title: VP Pick Prediction Options: - Kamala - June - May - Amy</td><td>Bad</td><td>The poll is semantically inconsistent with the input text. It incorrectly includes "May" and "June" as poll options, although they were mentioned in the conversation.</td></tr></table>	Input Text	Response	Rating	Explanation	PersonB: This week is endorsement week isn't it? Does anyone think we get a VP pick later this week? PersonA: I don't know, we're hitting the peak of deaths right around now. Maybe next week or this week after at the earliest. PersonC: It's usually not until very close to the convention. Maybe June this time though since everything has been wrapped up sooner? PersonA: Maybe, though a May announcement wouldn't surprise me. PersonB: Since you're an Amy supporter, are you thinking she'll be VP? I still think it'll be Kamela, but the Amy rumors are swirling as well.	Title: VP Pick Prediction Options: - Kamala - June - May - Amy	Bad	The poll is semantically inconsistent with the input text. It incorrectly includes "May" and "June" as poll options, although they were mentioned in the conversation.	A poll can be instruction following, with a title and 2 or more options, but it's possible the title or the options are not grounded.							
Input Text	Response	Rating	Explanation														
PersonB: This week is endorsement week isn't it? Does anyone think we get a VP pick later this week? PersonA: I don't know, we're hitting the peak of deaths right around now. Maybe next week or this week after at the earliest. PersonC: It's usually not until very close to the convention. Maybe June this time though since everything has been wrapped up sooner? PersonA: Maybe, though a May announcement wouldn't surprise me. PersonB: Since you're an Amy supporter, are you thinking she'll be VP? I still think it'll be Kamela, but the Amy rumors are swirling as well.	Title: VP Pick Prediction Options: - Kamala - June - May - Amy	Bad	The poll is semantically inconsistent with the input text. It incorrectly includes "May" and "June" as poll options, although they were mentioned in the conversation.														
Intelligent Polls	We find all examples in the guideline have the same format and punctuations. Does the poll need to follow such format and punctuations like the example below? If a poll doesn't follow, should we penalize the composition? Title: XXX Options: - XXX - vvv			Furthermore, please evaluate each dimension indepdently and avoid letting your assessment of them influence each other.	Close												
				Since puncuation is not specified in the guideline, I don't expect it to be penalized. However, let me check with the engineering team and get back to you. update--feedback from engineering DRI: "The poll does not need to follow that format, but the poll does need to have an explicit poll title and an explicit set of poll options. The quality of these is what we are interested in."
