

## VCG Base Creation & Edit Model workflow info

- Watch the recordings provided before starting with the guides.
- Use the newly given guidelines as unique and specific guidelines for each of the two workflows. Do not mix them up with previous Image evaluation or ADM guides, i.e. **do not use** past workflow guides as reference points.
- Take your time with the evaluation; do not rush or make assumptions.

### Base creation:

1. Mark an image as blurry if the entire image is blurry, and not if it's just the background.
2. In this workflow, Text Quality is its own dimension. Do **not** evaluate text quality under Structural integrity.
3. If there is text in the image that we can't read, mark it as Low Quality (irrelevant if it was requested or not). The option "can't tell" is only if the text was requested by the prompt but not present in the image.
4. For "Low poly" output style, pay attention to the details on the image. The subject has to show clear signs of polygons (mostly triangular but also quadrilateral) in order to match the style.
5. Photorealism output style means the image should look as if it was captured by a real camera.
6. Page 102 says Egyptian style but the image examples are Persian paintings. Page 103 says Benin Bronze but the pictures are also Persian painting. We have made the client aware of this.
7. Apparent ethnicity and gender will not be evaluated when there is a single person in the image.
8. For apparent ethnicity and gender, if there is even one person (in a group) whose face we cannot see, we should select "can't determine" for both options. Meaning, if the image has 5 people and we see two are male, two females, but we can't see the fifth one, it's "can't determine".
9. You can click on all images and click the + to expand. Use this to analyze the images carefully, specifically for Structural Integrity issues. Pay particular attention to humans and animals in the images; face features, eyes (gaze), fingers, limb proportions and numbers. Clear face distortions are Severe issues. Be detailed and apply proper criteria. Most obvious issues would **not** be "minor".
10. Pay attention on Alignment that all elements are properly covered and not partially or missing (e.g. "in a gym" verify that setting does look like a gym).

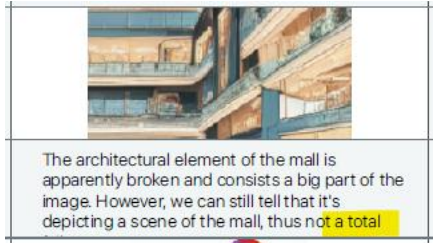

### Edit model:

1. Text quality **\*is\*** part of Structural Integrity. A spelling mistake can be Noticeable for single word images. Small artifacts in letters (e.g. 'joy' from the task) would be considered minor as long as the overall integrity is good and text is understandable/clear.
2. On page 37, there is a small piece of text missing. It should read "...reflecting in the output."

| Edit Instruction                | Input Image                                                                         | Output Image                                                                         | Rating                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Create a 3D diorama style image |  |  | The edited image somewhat follows the instructions with requested change mostly present, with minor deviations or inaccuracies on the details - Other: Output has snow-capped mountains that are different from the input, additionally there are some elements from the input that are not accurately reflecting in the |

(continued ↓)

3. On page 64, there is also some part of the text missing. It could read “...thus not a total failure”.

4. Some elements related to Visual Quality may also affect Structural integrity (dimension overlap). Implausible scene and spatial layout (pg. 81).
5. Page 103 and 105 have the same content, client is aware. Page 105 should list the 4 options that you can choose from when an image is Fair or Poor (e.g. image is blurry, different output style, etc.)
6. Page 121 is talking about comments not Usability. The client has been made aware. Page 122 is the content related to Usability.
7. Click on the images and expand them for evaluation. Analyze them carefully, especially Structural Integrity, Unedited portions and Character consistency.
8. Pay particular attention to humans and animals in the images; face features, eyes (gaze), fingers, limb proportions and numbers. Clear face distortions are Severe issues. Be detailed and apply proper criteria. Most obvious issues would **not** be “minor”.
9. Evaluate each image individually per dimension. First evaluate Left, then Right. Avoid combining the evaluations.
10. Pay attention to action required (change, remove, add, etc.) in the prompt as well as all elements required. This will affect the Instructions and Alignment dimensions.

Ignore the rating suggestions provided for the following example:  
“a girl and a boy sitting on a life ring” OR “two kids in life jackets”

Minor issues and Highly aligned are wrong ratings. Alignment should be downgraded and SI should be upgraded to a higher penalty.
