

# VCG Base Creation Feedback Apr09'26

## Error Analysis

- **High concentration of errors in the following areas:**
  - a. **Structural Integrity** → High (5+)
  - b. **Style Match** → High (5+)
  - c. **Contains All Requests** → High (4–5)
  - d. **Text-related errors** → Also significant (5)

Grader team is struggling most with:

- Understanding **what the image *should* look like structurally**
- Interpreting **style incorrectly** (Genmoji, Chibi, etc.)
- Fully checking **prompt completeness**

## Error Breakup

- **Under-penalization is the dominant issue**
  - Across multiple entries:
    - Minor issues marked when they should be **major**
    - Missing elements not penalized enough
    - Structural issues downplayed
  - Example patterns:
    - Extra fingers / distorted limbs → marked “minor”
    - Missing key prompt elements → still marked “captures most”
  - **Trend:** Team is being **lenient / conservative in grading**
- **Guideline misunderstanding is frequent**
  - Repeated root causes:
    - “GL Misunderstanding”
    - “Misread Context”
    - “Missed Key Information”
  - Especially in:
    - **Style Match**
    - **Text inclusion**
    - **A/B comparisons**
  - **Trend:** Not a skill issue — it’s a **guideline clarity + interpretation issue**
- **Text handling is messy**
  - Common issues:
    - Missing text not caught
    - Text present but wrongly judged
    - Spelling/case errors ignored or misgraded

- Example:
  - “SILENCE” not penalized correctly
  - Text required but marked as not needed
- **Trend:** No consistent framework for evaluating text
- **A/B judgment errors (Comparison mistakes)**
  - “A slightly better vs B perfect” misjudged
  - Context ignored while comparing
  - Wrong winner selected despite clear flaws
  - **Trend:** Weak **relative evaluation skills**, not just absolute grading

## RCA

- **People don’t know:** What = minor vs noticeable vs severe. They default to “safe” (under-penalize)
- **Graders are:** Observing randomly instead of following a structured scan
- **Style understanding is shallow:** Graders recognize style names but don't visually validate them
- Read prompts partially and miss constraints (objects, actions, text, style)

## Possible Solutions/Action plan

- **Image Scan (strict order)**
  - Structural Integrity (fingers, hands, face, anatomy)
  - Prompt coverage (missing elements)
  - Style match
  - Text accuracy
  - Visual quality
  - Improved zooming experience, particularly for small text
  - Enhanced accuracy in text rendering
- **Severity Calibration**
  - **Noticeable** → Issues on eyes, nose, mouth, ears, even if not noticed at first glance, are now upgraded to Noticeable (not minor anymore)
    - Examples:
      1. There is a small distortion in the judge’s eyes, particularly his left eye (our right side). Notice how it’s not perfectly round at the bottom. This is now a Noticeable issue.

2. Observe the swimmer's left foot, there's a small flaw in the foot that is noticed upon closer inspection. This is now a Noticeable issue.

3. Analyze the images carefully, while expanded. Observe the thumb anomaly and the person's right eye (our left side). The eye is slightly bigger and flatter on the bottom. Noticeable issue based on latest criteria.

4. Observe the elements on the buildings, objects, background very carefully. The statues, decorative elements on the tower have some distortions. These are a minor issue, due to not being obvious at first glance.

- **Noticeable** → Visible but not breaking
    - Examples:
1. The weight plate in this position does not make sense and appears to be floating. There's a break of flow and sense to the scene. This should be a noticeable issue.

2. The vehicle appears to have two steering wheels, which is unrealistic and indicated a clear Noticeable issue.

3. The truffle seems to be connected to the stick, which is actually undefined and difficult to identify what it represents. This should be a Noticeable issue.

- **Severe** → Breaks realism / intent
  - Examples:
- 1. Observe the fingers on the woman's hands. There are heavy distortions in the fingers leading to a Severe SI issue.

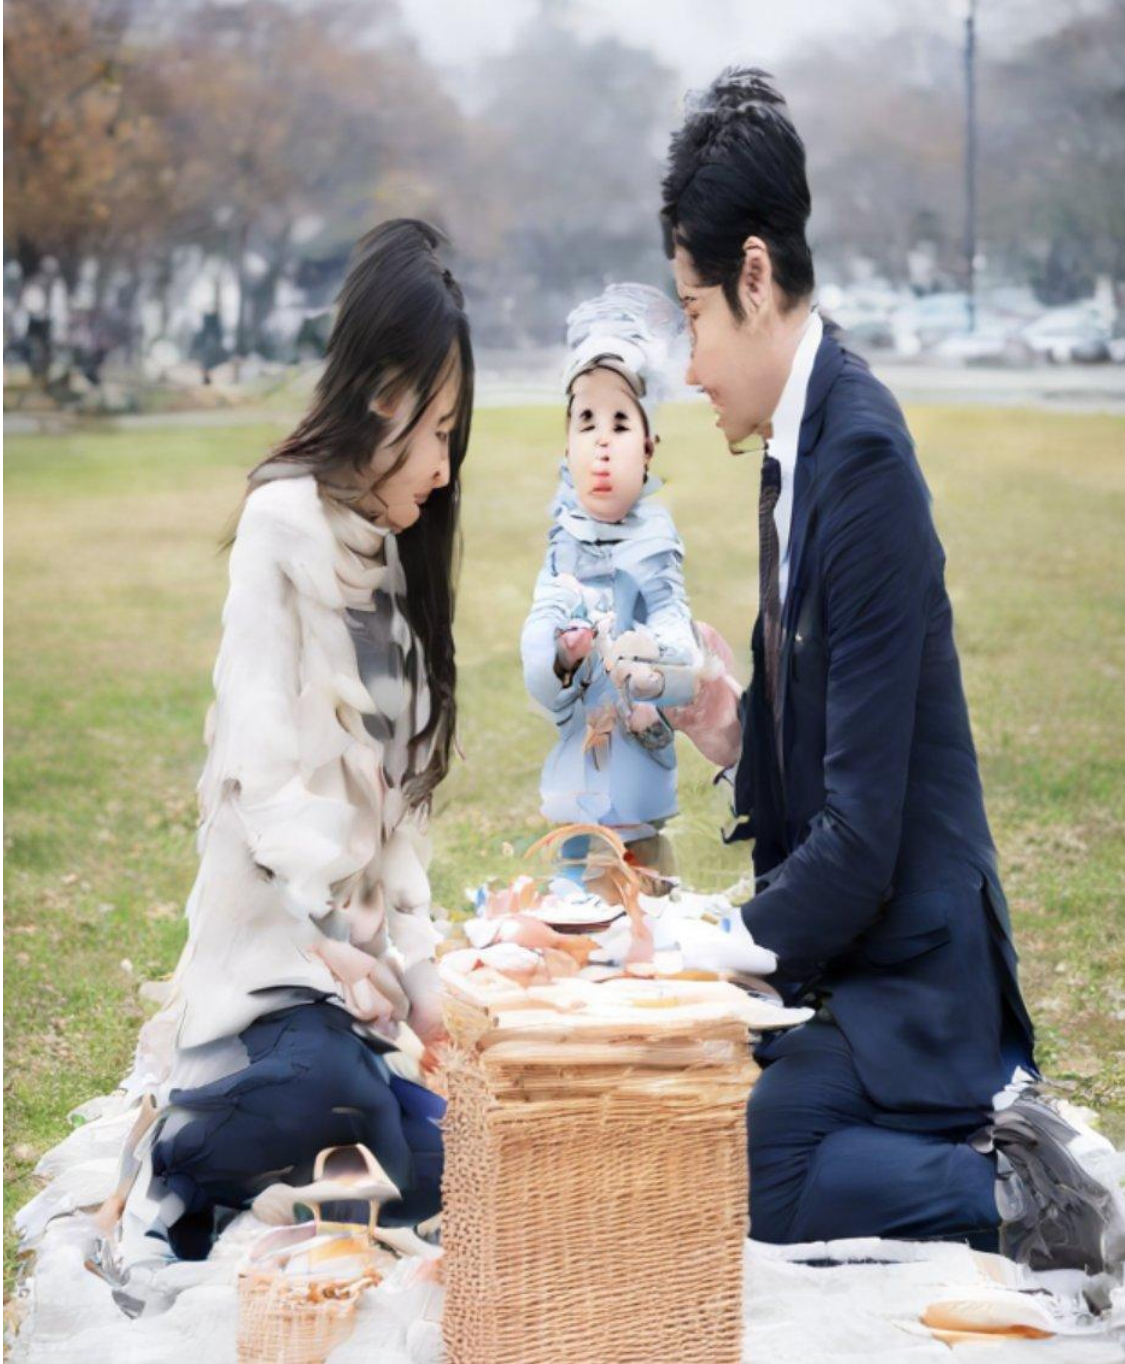

2. The dinosaur's head is merged with a strange root or bone structure creating a very oddly creature. This is a clear example of a Severe SI. Note also, the person's left hand seems to be missing and the object the person is holding is also undefined.

3. Everything in the image is distorted, the baby looks like it has a double of most facial features. These are severe SI issues.

4. The person has a severely distorted, elongated head and melted hands that lack fingers or clear definition. The lips area also appears unnatural. The overall image appears distorted and should be labeled as Severe SI.

5. The swimmer does not have any facial features, the hand is very small compared to the rest of the body, feet look oddly sized and second arm appears distorted. This should be Severe SI issues.

6. The person's face and especially the hands, show visible distortions. The carrot is also overly large. These constitute issues that fall under the Severe SI based on new criteria.

- **Penalty Calibration**
  - Incorrect number of fingers → Severe issue → affects only Structural Integrity Dimension

Extra fingers on the person's hand, falls under severe structural integrity. GL page 41 - example with the monkey.

Similar to the previous case, only less fingers than expected. GL example page 41 - number of fingers is incorrect.

- Missing some elements (color, action, atmosphere, object, relationship, etc.) → Captures most but not all → affects Input/Output Alignment
- Failure to capture all or most elements leads to a failure in Input/Output Alignment, particularly when the request is for one key element and the output is an entirely different object.

**Prompt:** Write 'I Ustand' (Out of Order) as a neon sign made entirely of spaghetti.

**Correct grading:** Captures most but not all

**Reason:** The request was specifically for the neon sign to be made of spaghetti and the output provided the spaghetti separately. This is **not** a fully aligned image, and needs to be downgraded.

**Prompt:** A wilted flower bends towards a cracked window during a storm

**Correct grading:** Captures most but not all

**Reason:** The prompt required several elements; the relationship between the flower and the window (bends towards the window) is not represented. Therefore, this cannot fully satisfy the request and should be downgraded.

**Prompt:** Rusty dumbbells

**Correct grading:** Not aligned

**Reason:** The primary element required is “dumbbells”. The attribute is that they should be rusty. The primary object is not represented at all, failing to align with the user request. An entirely different rusty object would not be satisfying.

If the output provided regular dumbbells (not rusty) it could be considered as “captures most but not all”.

- Minor or major portions lack sharpness are out of focus Slight blur → impacts Visual Quality

Image The image contains a blur. It's more prominent on the bottom half, particularly the grouped people on the right. GL page 52 - portions of the image lack sharpness, lacking focus.

The lower cat is partially blurry; back part of the body and tail. It is also one of the main subjects in the image. This leads to a downgrade in Visual quality.

Image 3: NOT blurry. The facial distortions are part of Structural integrity and not Visual Quality. Visual Quality here is fine.

- **Session on Genmoji**
  - Genmoji vs other illustrations
  - Genmojis: AI-generated emoji users can create on their devices on the fly.
  - Refer to demo examples or research to understand better style, coloring, smoothness of features

### Genmoji Demo

Observe the features for the human genmojis

Which image fits the genmoji criteria?

The image on the left is a completely different, unrelated style. Should be marked as Does not Match.

Which image fits the genmoji criteria?

The image on the right is a completely different, illustration style. Should be marked as Does not Match.

Which image fits the genmoji criteria?

The image on the right is a completely different, illustration style. Should be marked as Does not Match.

- **Image Comparison understanding**

- **Pick the LESS wrong image, not the better-looking one**
- Checklist:
  - Which misses fewer prompt elements?
  - Which has fewer structural issues?
